TRIAL SUCCESS: SALES UP 62.3%

The Quantum data analytics trial has delivered exceptional results. The new store layout strategy proved highly effective, driving a significant increase in chip category sales of up to 62.3% compared to control stores.

Key Finding: The redesigned layout optimized product placement and customer flow, resulting in measurable uplift across participating trial stores. This data-driven approach validates the strategic investment in layout optimization.

The trial demonstrates that evidence-based merchandising decisions can deliver substantial commercial returns without relying on price reductions.

CUSTOMER BEHAVIOR INSIGHTS

Our analysis reveals that mainstream customers are the primary drivers of chip category growth. Understanding their purchasing patterns and preferences is essential for optimizing store layouts and product placement strategies.

- MAINSTREAM CUSTOMER FOCUS → 175G PACK PREFERENCE
- PREMIUM BRAND APPEAL → VALUE-DRIVEN PURCHASES

The new store layout trial demonstrated significant sales improvements across all test locations compared to control stores. These results validate the effectiveness of the strategic layout changes and provide strong evidence for broader implementation across the retail network.

TRIAL STORE PERFORMANCE RESULTS

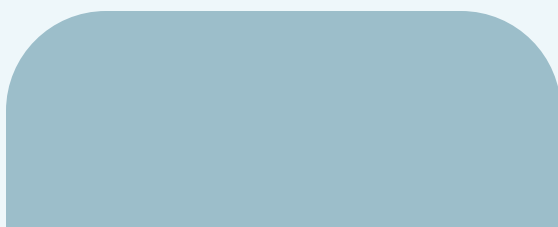

Store Performance vs Control Stores:

Store 77: +62.3% sales increase - highest performing trial location with optimal customer traffic patterns.

Store 86: +31.5% sales increase - strong performance in suburban high-density area.

Store 88: +20.0% sales increase - consistent improvement in regional market segment.

All trial stores outperformed control group benchmarks significantly.

ACTION PLAN

Strategic Implementation for Layout Rollout.

Based on the successful trial results showing up to 62.3% sales increase, Quantum recommends a phased rollout strategy. Prioritizing high-traffic stores and premium shelf positioning will maximize return on investment.

- HIGH-TRAFFIC STORE ROLLOUT
- FOCUS ON 175G PACK DISPLAYS
- PREMIUM SHELF SPACE PRIORITY
- TARGET MAINSTREAM CUSTOMERS

Implementation Timeline:

Phase 1: Deploy new layout to top 50 high-traffic stores → Monitor sales lift over 8 weeks. Phase 2: Expand to remaining stores based on performance data and customer traffic patterns.

STRATEGIC RECOMMENDATION

Based on our comprehensive analysis, the key to maximizing chip category performance lies in strategic value creation rather than price reduction.

Key Recommendation:

Focus on value-add promotions over price cuts. Our data shows that mainstream customers respond more positively to perceived value enhancements than discounts. Premium brand positioning with 175g pack sizes drives higher margins. Bundle promotions and loyalty rewards outperform straight discounts. Price cuts erode brand perception and long-term profitability.

QUANTIUM DATA ANALYTICS

THANK YOU

DATA-DRIVEN INSIGHTS FOR STRATEGIC GROWTH

Thank you for your attention. Our analysis confirms the trial's success with sales increases up to 62.3%. We look forward to supporting the nationwide rollout.
